

6.8.0

16/04/2024 11:42 am BST

Actions List on the Operation Workstation Screen

Operators can now see a list of action steps that occur within an operation. The actions list will appear in the stats profile on the lower left-hand corner of the Workstation Screen. Each action item will self-check as the operator progresses through the operation.

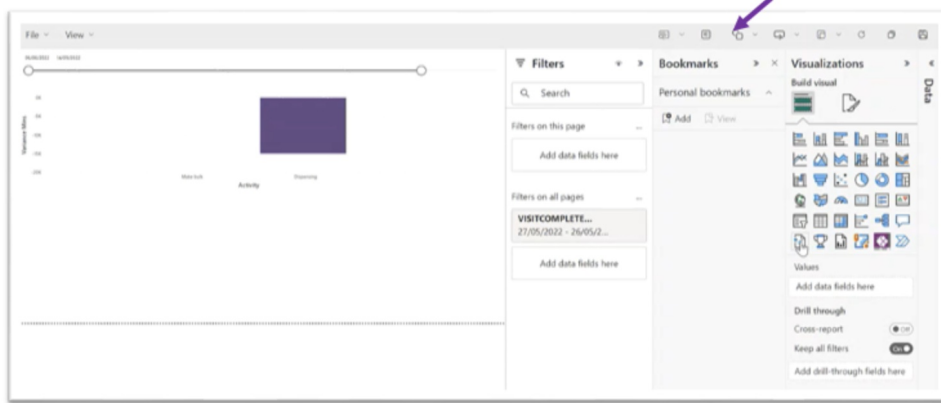

Restful API

We have extended our sync service capabilities. MESTEC can now be enabled to communicate with on-prem restful API endpoints. This means MESTEC can communicate from the cloud to on-prem without requiring a private VPN tunnel and without punching a hole in your firewall.

Power BI Bookmarks

Users can save Power BI Bookmarks to reference custom reports. Previously, upgrading MESTEC to the latest version would reset these bookmarks. But with 6.8.0, bookmarked reports will now travel with each upgrade. No need to recreate.

By Customer Request...

- The Stock Items Screen now loads much faster.
- We have added a SUID field to Work Centre Groups.
- The User Group screen now displays a User's Primary Group.
- To avoid double printing, label printing will no longer auto-occur when completing a print task.
- Single Sign-On users with many tabs open will no longer experience unexpected time-outs.
- A Where Used query from the Products screen will now provide users the option to export the results into excel.

Test Plan Manager

The Test Plan Manager currently works as an in-house test management tool. It is a repository that holds test suites, test data, and instructions of MESTEC core journeys and customer edge cases. It allows test management, test execution, defect management, and viewing of the overall status of test execution. The contents of this plan are maintained and managed by MESTEC QA. It is updated regularly to align with changes made to the product. Customers can now create a copy of our master test plan and customize it as desired.
